

Infrastructure Training

Lesson 4 Recap

Web.config explained

Nlog section – targets, rules

Orchestrator uses the NLog library to collect messages from various sources and send them to various targets

Sources: Robot, Quartz Scheduler, Orchestrator application itself

Targets: standard targets (Event Log, File, Database) and custom targets (Elasticsearch)

Rules: divide logs from Robots to different targets based on Log Level

Use variables for index name (Elasticsearch) or for file name (example from NLog.config on the robot machine)

Additional information on <https://www.codeproject.com/Articles/10631/Introduction-to-NLog>

Queues parameters

inProgressMaxNumberOfMinutes

- default 1440 (24 hours)
- Queue items that stay “In Progress” for more than 24 hours are marked as “Abandoned”

QueuesStatisticsScheduleCron

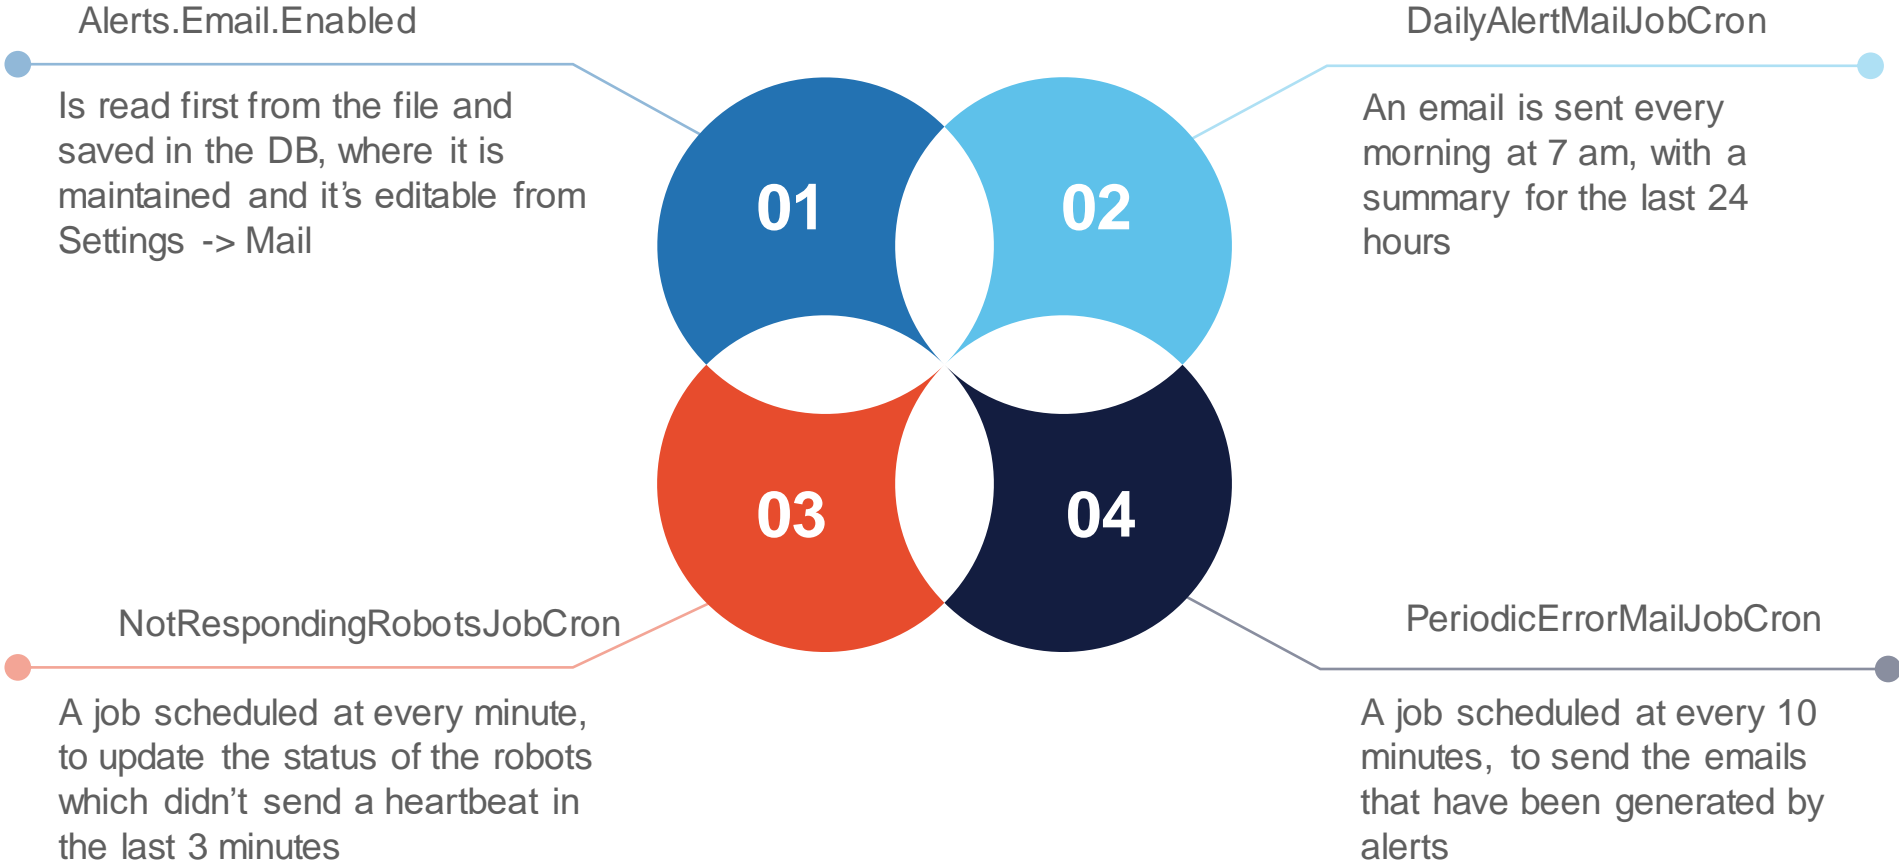

- default at second 10, every minute
- Calculate number of in progress and remaining items, average processing time, number of errors for each queue

UpdateUncompletedItemsJobCron

- default every hour
- How often to check for “In progress” items to make them “Abandoned”.

Alerts parameters

Windows authentication

Allow registered users to login with the Windows button, instead of providing username and password

Windows Authentication in IIS needs to be enabled for the website

In web.config set WindowsAuth.Enabled to true and put domain name in WindowsAuth.Domain – short domain name or long domain name

Do not turn WindowsAuth.AutoLogin.Enabled to true, unless you want the application to try to authenticate the user directly with current Windows user, without displaying the login page

Authentication Cookie expiration

Auth.Cookie.Expire - set the expiration time, in minutes, of the Authentication Cookie

Default value is 30 minutes

Enable “Become a tenant”

Tenants can be created regardless of the presence of the “Become a Tenant” button; that button on the login page is to let any visitor to create a tenant.

Tenant management is made by using the following values on the login page: Tenancy name: host, Username or email: admin, Password: the password that was given to you by UiPath

Tenant.Registration.Enabled set to true in 2017.1 to display the “Become a Tenant” button on the login page. Set it to false to hide the button

For 2018.1, the initial value from web.config is copied into the DB after the DB is created and can only be changed from Tenant Management page

Packages path “NuGet.Packages.Path”

Packages published by UiPath Studio to Orchestrator or manually uploaded from the Packages page are stored by Orchestrator in a NuGet feed. Orchestrator has its own (built-in) NuGet server, but can also use other NuGet feed

Packages managed by Orchestrator's NuGet server can be stored on the local drive or on a network share

When multiple nodes of Orchestrator are used, all should be able to access the same packages path; or synchronize the folders if each Orchestrator node uses a different folder

When Deployment URL is non-empty in Settings -> Deployment, then it will be used instead of NuGet.Packages.Path

Activities path “NuGet.Activities.Path

A great place to host different versions of activities, used by different processes. The robots will download the activity packs that are missing, from this location, when they need it

Feature used when Robots don't have internet access to download the activities from UiPath's Gallery

Activities should be manually put in the location indicated by this application setting. Orchestrator will not download activities. Orchestrator does not need internet access

Organization units

Separation is ensured for all the pages that appear when using the left side menu

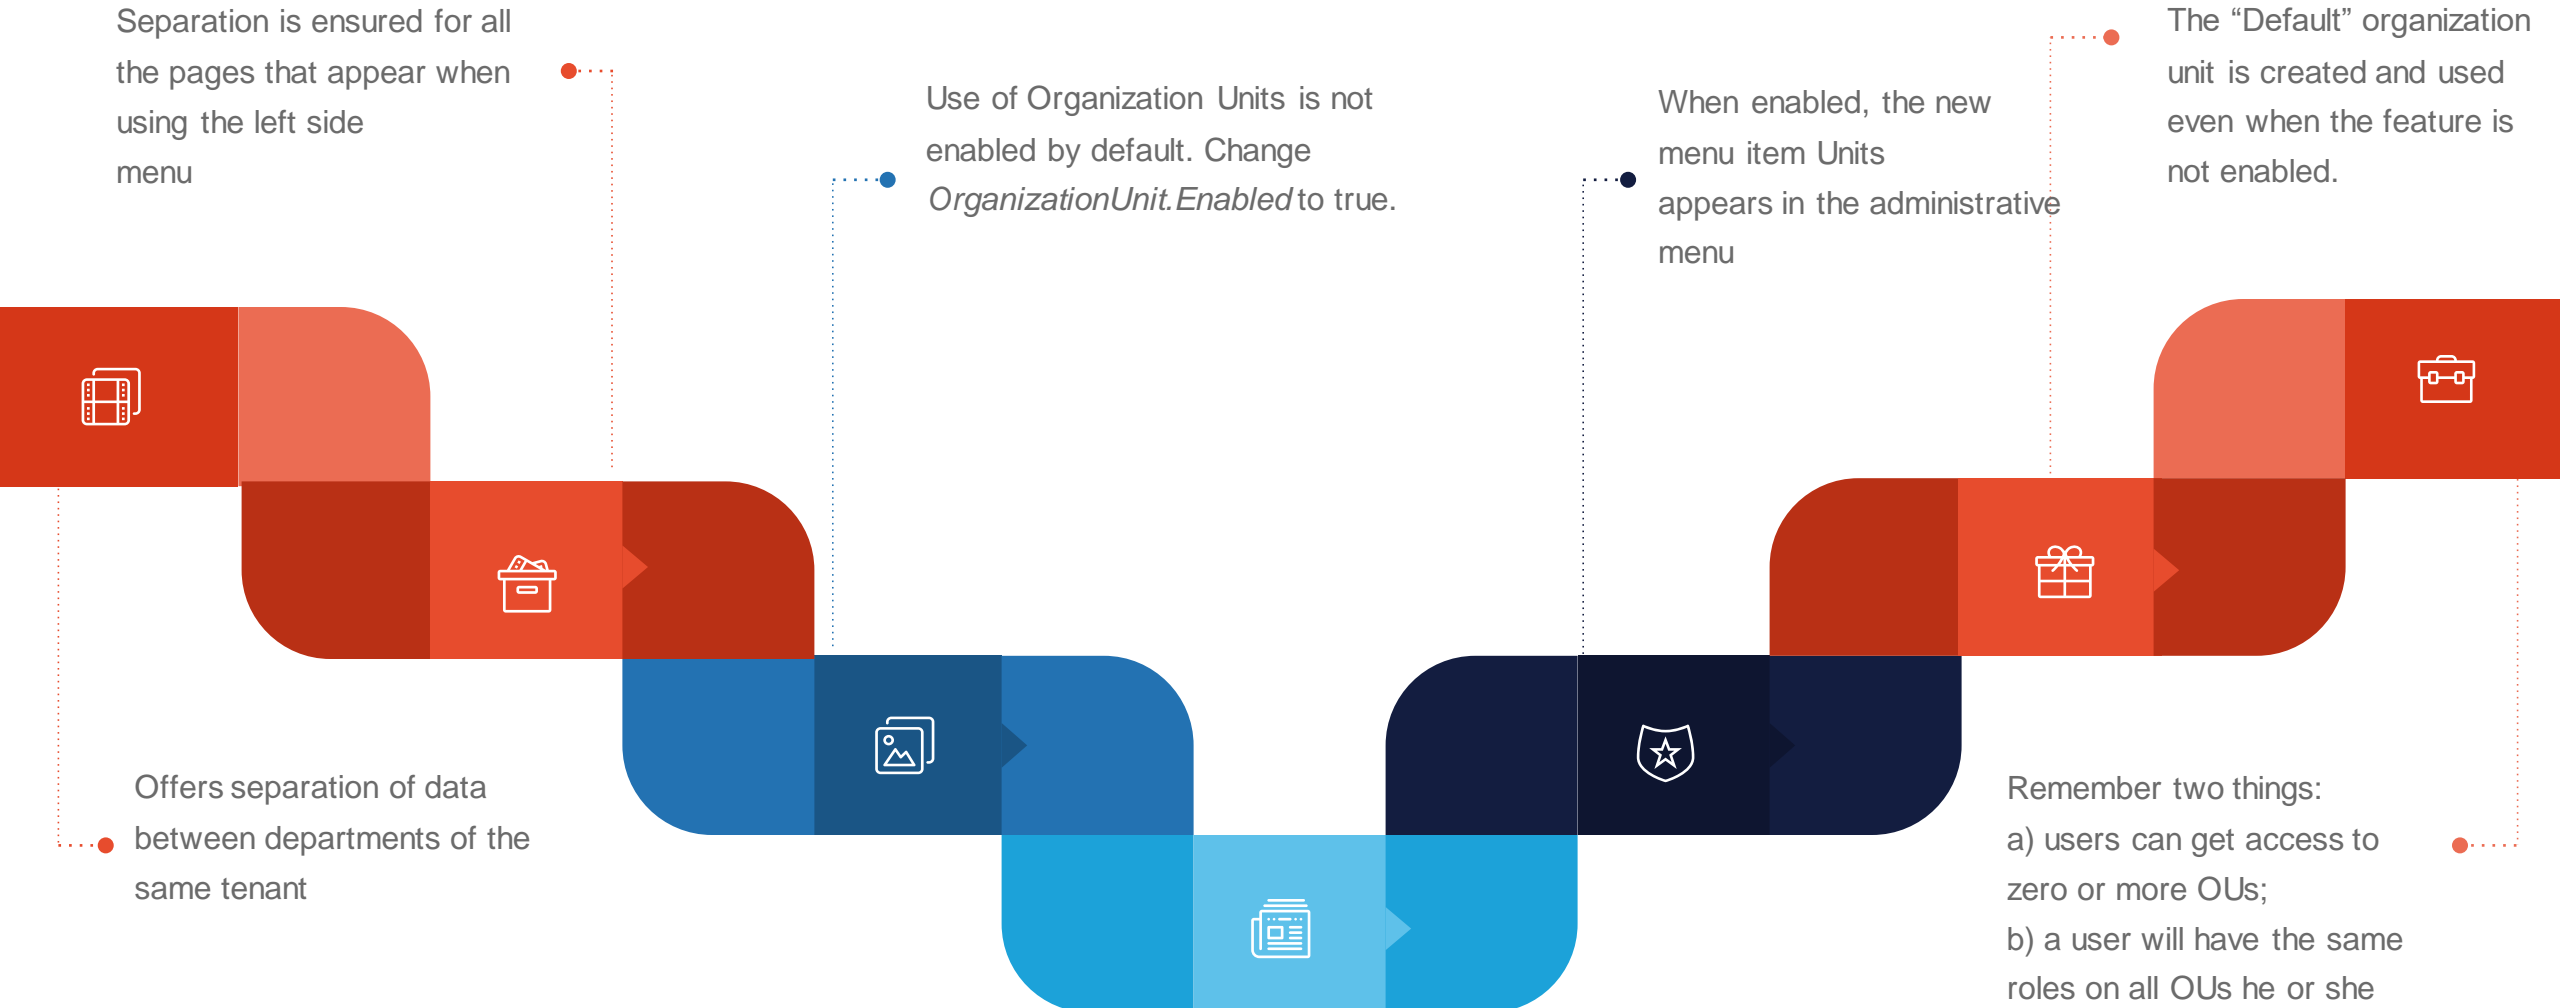

Use of Organization Units is not enabled by default. Change *OrganizationUnit.Enabled* to true.

When enabled, the new menu item Units appears in the administrative menu

The “Default” organization unit is created and used even when the feature is not enabled.

Offers separation of data between departments of the same tenant

Remember two things:
a) users can get access to zero or more OUs;
b) a user will have the same roles on all OUs he or she has access

CyberArk

Integration with CyberArk is implemented through the use of CyberArk AIM module on the same server as Orchestrator

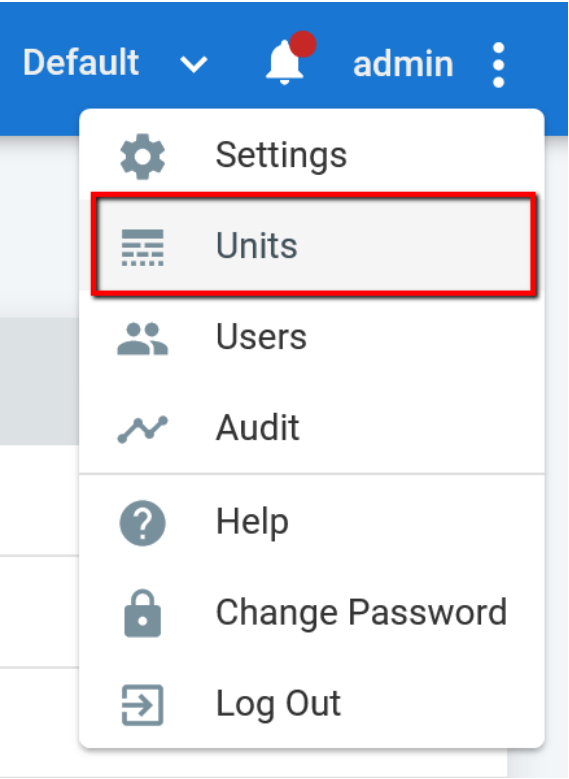

Orchestrator integration with CyberArk is for robots' passwords only

The following keys need to be set in web.config: the value for *Vault.Type* should be "CyberArk" and the other 3 keys starting with *Vault.CyberArk* need to be set with values obtained from CyberArk administrator

Organization units

CyberArk

Terms and Conditions

TermsAndConditionsRegisterUrl
allows
you to change the URL that is
used when the
users click on “Terms and
conditions” link
on the login page.

Help URL

HelpUrl allows you to change the URL that is used when the users click on “*Help*” icon in the upper right corner.

The value is global, for all tenants.

Thank you!
